Create an External IP

1. AI PLATFORM - NOTEBOOKS: create a customised instance.

2. VPC NETWORK – EXTERNAL IP ADDRESSES: before running any process, make the IP static and external. For that, find the row corresponding to your instance, which must have an ephemeral IP address.

3. COMPUTE ENGINE – VM INSTANCES: check that your instance is connected to your newly external IP. IP addresses must match.

Configure the Firewalls

4. VPC NETWORK – FIREWALL RULES: customise the firewall rules as desired. This includes specifying the ports, and whether allow ingress or egress.
